Gaston Cremieux, 91057 Evry cedex, FRANCE

PCR was performed on DNA from transformants of Arabidopsis thaliana

plants from INRA (Versailles). The DNA fragment(s) resulting from

the PCR were directly sequenced from the left or the right border

to determine the genomic sequence flanking the insertion. T-DNA

derived sequences were removed. Information to order the

corresponding mutant line and a link to a database providing a

graphical display of the insertion site are available at

http://dbsgap.versailles.inra.fr/publiclines/. This sequence has

been generated in the framework of the French plant genomics

program 'Genoplante' (http://www.genoplante.com and

http://genoplante-info.infobiogen.fr).

T-DNA tagged line 031-2, PCR fragment 031-2XA; Transgenic plant
line 031-2 was obtained by transformation with the T-DNA of
pPCV6NFHyg Agrobacterium binary vector; the left border junction of
T-DNA insertion 031-2XA was isolated by PCR amplification using the
LB2 (5'-CTGGGGAATGCGGAATCAAGGCATCGATCGGAAG-3') and PC3

(5'-CCTTGCGCCTGAGTGCTTGCGGCAGC-3') primers and sequenced with the
PC3 primer as described by Mathur et al. Plant J. (1998) 13,
707-716; the PCR-amplified DNA fragment extends from an XbaI site
to the left border junction of pPCV6NFHyg T- DNA tag, sequences of
the left T-DNA end are excluded from the submission
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Koncz,C., Szabados,L., Gruneberg,B. and Schaefer,S. Gene identification with sequenced T-DNA tags in Arabidopsis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Eukaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta; Spermatophyta; Magnoliophyta; eudicotyledons; core eudicotyledons; rosids; eurosids II; Brassicales; Brassicaceae; Arabidopsis.

ABRC Stock Number CS827897; T-DNA left border flanking sequences of Syngenta Arabidopsis Insertion Library (SAIL) lines are available through the Arabidopsis Biological Resource Center (ABRC). Sequences represent a pool of amplified genomic regions and not single contiguous sequences.

Class: TDNA tagged.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Contact: Sessions A

An Arabidopsis full-length cDNA library was constructed essentially
as reported previously (Seki et al., 1998).cDNA cleaved with BamHI
as reported previously (Seki et al., 1998).cDNA cleaved with BamHI
and XhoI was ligated to modified Lambda FLC-1 vector (Carninci et
al., submitted for publication) digested with BamHI and SalI. This
clone is in a modified pBluescript vector. Please visit our web
site (http://www.gsc.riken.go.jp/e/plant/index_e.html) for further

An Arabidopsis full-length cDNA library was constructed essentially
as reported previously (Seki et al., 1998, 2002). This clone is in a
modified pBluescript vector.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Site 1 ECORE, Site 2: XhoI, Parent Washington navel orange embryogenic Callus was established from undeveloped ovules of ca. 10 mm diameter young fruits under open pollination on Murashige-Skoog medium at 25oC with 16 h light in a tissue culture room. Embryogenic callus, globular and heart stage embryoids were pooled in approximately equal portions in RNAlater (Ambion), then RNA was extracted using TRIZOL Reagent (Invitrogen). Poly(A) RNA was purified from 500 microgram of total RNA using Qiagen Oligotex. A primary cDNA library was produced using a lambda ZAP XR cDNA Synthesis kit (Stratagene). These steps were performed by Xinrong Ye (Roose lab, UC Riverside). One million pfu from the primary library were mass excised to produce a phagemid population by Raymond Penton (Close lab, UC Riverside). Phagemids were plated, plasmid DNA purified, cDNA clones archived, and DNA sequences determined bi-directionally using an ABI3730 at DNA Landmarks (Landry, Hubert, Laforest, Landry, Ligonde). Chromatogram files were downloaded by FTP to UC Riverside (by Close), then processed at UC Riverside (by Wanamaker, Close lab) using the HarvEST pipeline (http://harvest.ucr.edu) to remove vector and cloning oligo sequences and various contaminants, and to trim to a high quality region. Sequences that retained a phred 17 region of at least 100 bases were assembled, then chimeras were removed following manual inspection of assemblies (Close, Roose, Federici, Wanamaker, Lyon, Ye, Jang, Collin, Xacar, Ikeda, Quinitio). Sequences that survived all removal steps were submitted to GenBank."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            It indicates an insertion close to or within gene At5g43860. Details on the protocols used for generation of the sequence are described in References 1-3. The sequences are generated at the MPI for Plant Breeding Research in the context of the GABI-Kat project. GABI-Kat is part of the German Plant Genomics program designated 'GABI'. Information on line availability can be found at: http://www.mpiz-koeln.mpg.de/GABI-Kat/.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note=PPCR was performed on DNA from Arabidopsis thaliana plants (T1) which were transformed with the T-DNA from vector pAC161 (GenBank accession number: AJ537514). The lines contain one or more T-DNA insertions. The DNA fragment(s) resulting from the PCR were directly sequenced to determine the genomic sequence flanking the insertion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           T-DNA derived sequences were removed

Interary Ocksober 2.

Interary Callus was established from undeveloped ovales of ca. 10 mm diameter young fruits under open ovales of ca. 10 mm diameter young fruits under open pollination on Murashige-Skoog medium at 250C with 16 h light in a tissue culture room. Embryogenic callus, globular and heart stage embryoids were pooled in approximately equal portions in RNAlater (Ambion), then RNA was extracted using TRIZOL Reagent (Invitrogen). Poly(A) RNA was purified from 500 microgram of total RNA using Qiagen Oligotex. A primary CDNA library was produced using a lambda ZAP XR CDNA Synthesis Kit (Stratagene). These steps were performed by Xinrong Ye (Roose lab, UC Riverside). One million pfu from the primary library were mass excised to produce a phagemid population by Raymond Fenton (Close lab, UC Riverside). Phagemids were plated, plasmid DNA purified, cDNA clones archived, and DNA sequences determined bi-directionally using an ABI3730 at DNA Landmarks (Landry, Hubert, Laforest, Landry, Ligonde). Chromatogram files were downloaded by FTP to UC Riverside (by Close), then processed at UC Riverside (by Wanamaker, Close lab) using the HarvEST pipeline (http://harvest.ucr.edu) to remove vector and cloning oligo sequences and various contaminants, and to trim to a high quality region. Sequences that retained a phred 17 region of at least 100 bases were assembled, then chimeras were removed following manual inspection of assemblies (Close, Roose, Federicl, Wanamaker, Lyon, Ye, Jang, Collin, Kacar, Ikeda, Quinitio). Sequences that survived all removal steps were submitted to GenBank."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            909-787-3318

were grown from seed in greenhouses at UC Santa Barbara. From these plants three sets of tissue were collected: 1) Small flower buds (<10 mm) and very young inflorescences (71 & 29% by weight respectively), 2) Medium (7-20 mm) and very yeight respectively) and 3) Shoot apical meristems. A fourth set of tissue was collected from plants of A. formosa. These plants were grown from seed in sand and at approximately 1 month root tissue and leaf tissue of various developmental stages were collected (4 & 16% by weight respectively). Total RNA was extracted from each set of tissue and pooled in the following proportions:

1.5X from sets 1 & 2, 1X from sets 3 & 4. From the pooled total RNA, mRNA was extracted and enriched for full-length messages and then normalized with proprietary methods by Invitrogen."

DNA encoding chlorophyllase, useful for producing transgenic plants.

Claim 5; Page 12-14; 21pp; Japanese.

of a plant The present sequence is a chlorophyllase protein coding sequence. The chlorophyllase protein coding sequence can be used for the transformation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel substantially purified nucleic acid molecule encoding a phytol kinase. The nucleic acid molecules and polypeptides of the invention may be useful in mediating tocopherol biosynthesis and in producing plants with increased drought resistance. The current sequence is that of the thale cress chlorophyllase 2 DNA of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  05-AUG-2002;

Chlorophyllase enzyme is involved in chlorophyll degradation in plant cell senescence. Sequences of the invention are used to produce a plant by transforming a plant cell with chlorophyllase and regenerating a plant from the transformed plant cell. They may also be used to transform cells. The plants that are produced can have economical importance as they can allow for the controlled induction or postponement of senescence. The present sequence is grape chlorophyllase cDNA from vrllc.pk008.021:fis clone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  An isolated polynucleotide encoding a plant chlorophyllase polypeptide, used to produce transformed plants that have controlled induction or postponement of senescence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sg

XX
PT An isolated polynucleotide encoding a plant chlorophyllase polypeptide, PT used to produce transformed plants that have controlled induction or PT postponement of senescence.

XX
PS Claim 5; Page 56-57; 69pp; English.
```

The invention relates to plant chlorophyllase (EC 3.1.1.14) proteins and polynucleotides encoding such proteins. Chlorophyllase enzyme is involved in chlorophyll degradation in plant cell senescence. Sequences of the invention are used to produce a plant by transforming a plant cell with chlorophyllase and regenerating a plant from the transformed plant cell. They may also be used to transform cells. The plants that are produced can have economical importance as they can allow for the controlled induction or postponement of senescence. The present sequence is tulip chlorophyllase cDNA from etplc.pk005.dl6:fis clone. (Updated on 07-AUG-2003 to correct OS field.)

                                                                                                                                                                                                                                                 The invention relates to plant chlorophyllase (EC 3.1.1.14) proteins and polynucleotides encoding such proteins. Chlorophyllase enzyme is involved in chlorophyll degradation in plant cell senescence. Sequences of the invention are used to produce a plant by transforming a plant cell with chlorophyllase and regenerating a plant from the transformed plant cell. They may also be used to transform cells. The plants that are produced can have economical importance as they can allow for the controlled induction or postponement of senescence. The present sequence is grape chlorophyllase cDNA from vdblc.pk002.pl9:fis clone

                                                                                                                                                                                                                                                                                                                                             The invention relates to plant chlorophyllase (EC 3.1.1.14) proteins and polynucleotides encoding such proteins. Chlorophyllase enzyme is involved in chlorophyll degradation in plant cell senescence. Sequences of the invention are used to produce a plant by transforming a plant cell with chlorophyllase and regenerating a plant from the transformed plant cell.
                                                                                                                                                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                          chlorophyllase

                                                                                                                                                                                                                                                                                                                  They may also be used to transform cells. The plants that are produced can have economical importance as they can allow for the controlled induction or postponement of senescence. The present sequence is corn
